AI4Science Summer Camp

2026 Team Project Topics

Each camper should join a team. After the first week of tutorials, each team selects one project to pursue with its team leader.

Team leader	Background and interests	Project topic
Zaibul Anam PhD student, Mechanical Engineering	AI materials design; computational materials	**Materials-property prediction** Elastic moduli or band gap
Yoma PhD student, Mechanical Engineering	AI materials design and computational materials; combines DFT, high-throughput molecular-dynamics simulations, and machine learning to investigate ionic diffusion and predict ionic conductivity.	**Ionic-conductivity prediction and battery-materials discovery**
Suhas Bhat PhD student, Chemistry and Biochemistry	Computational chemistry, molecular modeling, and scientific computing	**Molecular-property prediction using machine learning**
Sadman Omee PhD student, Computer Science and Engineering	AI, deep learning, and AI for materials discovery	**Superhard-materials prediction and discovery** Machine learning or deep learning
Nicholas Miklaucic PhD student, Computer Science and Engineering	AI, generative deep learning, AI for materials discovery, and large language models	**Generative materials discovery** Find novel stable materials using deep learning and AI, including MatterGen or related models
